100% works 100% I downloaded it from I have tried it on two or three computers, including a laptop and even on a Macbook that can't run anything except iWork, and it always works perfectly. I was originally skeptical because they say you need to run it in safe mode, but it's actually quite simple. If you see a black screen with a red arrow on the top left or a question mark on the bottom left, just tap Esc to bring up the menu and then select Safe Mode from the menu. Then your computer should start up normally. I've been using this for almost a month now, and I've never had any issues. I recently purchased the "hack & steal" game from the app store, and I don't think the game used this plugin or anything like it, because it's far less stable than this. If you have any questions, just reply to this thread, and I'll answer any questions you might have.

Q: The time required to upload a CSV file to S3 I've searched around and found some answers. I'm new to AWS. I have a Ruby script that uploads a CSV file to S3. The documentation says: This operation will require a network transfer, so it is much slower than file upload. The method is configured to only accept one object at a time and returns after the object is uploaded successfully or an error occurs. But I think I will have more than one object. How do I upload the CSV file and complete the upload as fast as possible? Or do I just have to wait for it to finish?

A: I found it on aws.amazon.com/articles/AGA082790.htm. We do support batch uploads, just not for direct upload. To upload multiple objects at once you have to call `s3.complete_multipart_upload` and supply the name of the object file in the form of a list. A `complete_multipart_upload` call is not guaranteed to return immediately and can require up to 30 minutes. I'm creating a class that calls these functions.

```
S3Uploader = AWS::S3::S3Object.new("bucket_name", "key") def
file_upload(file) aw 82157476af
```
